**COST-728/NetFAM workshop, DMI, Copenhagen,
21-23 May 2007**

www.csiro.au

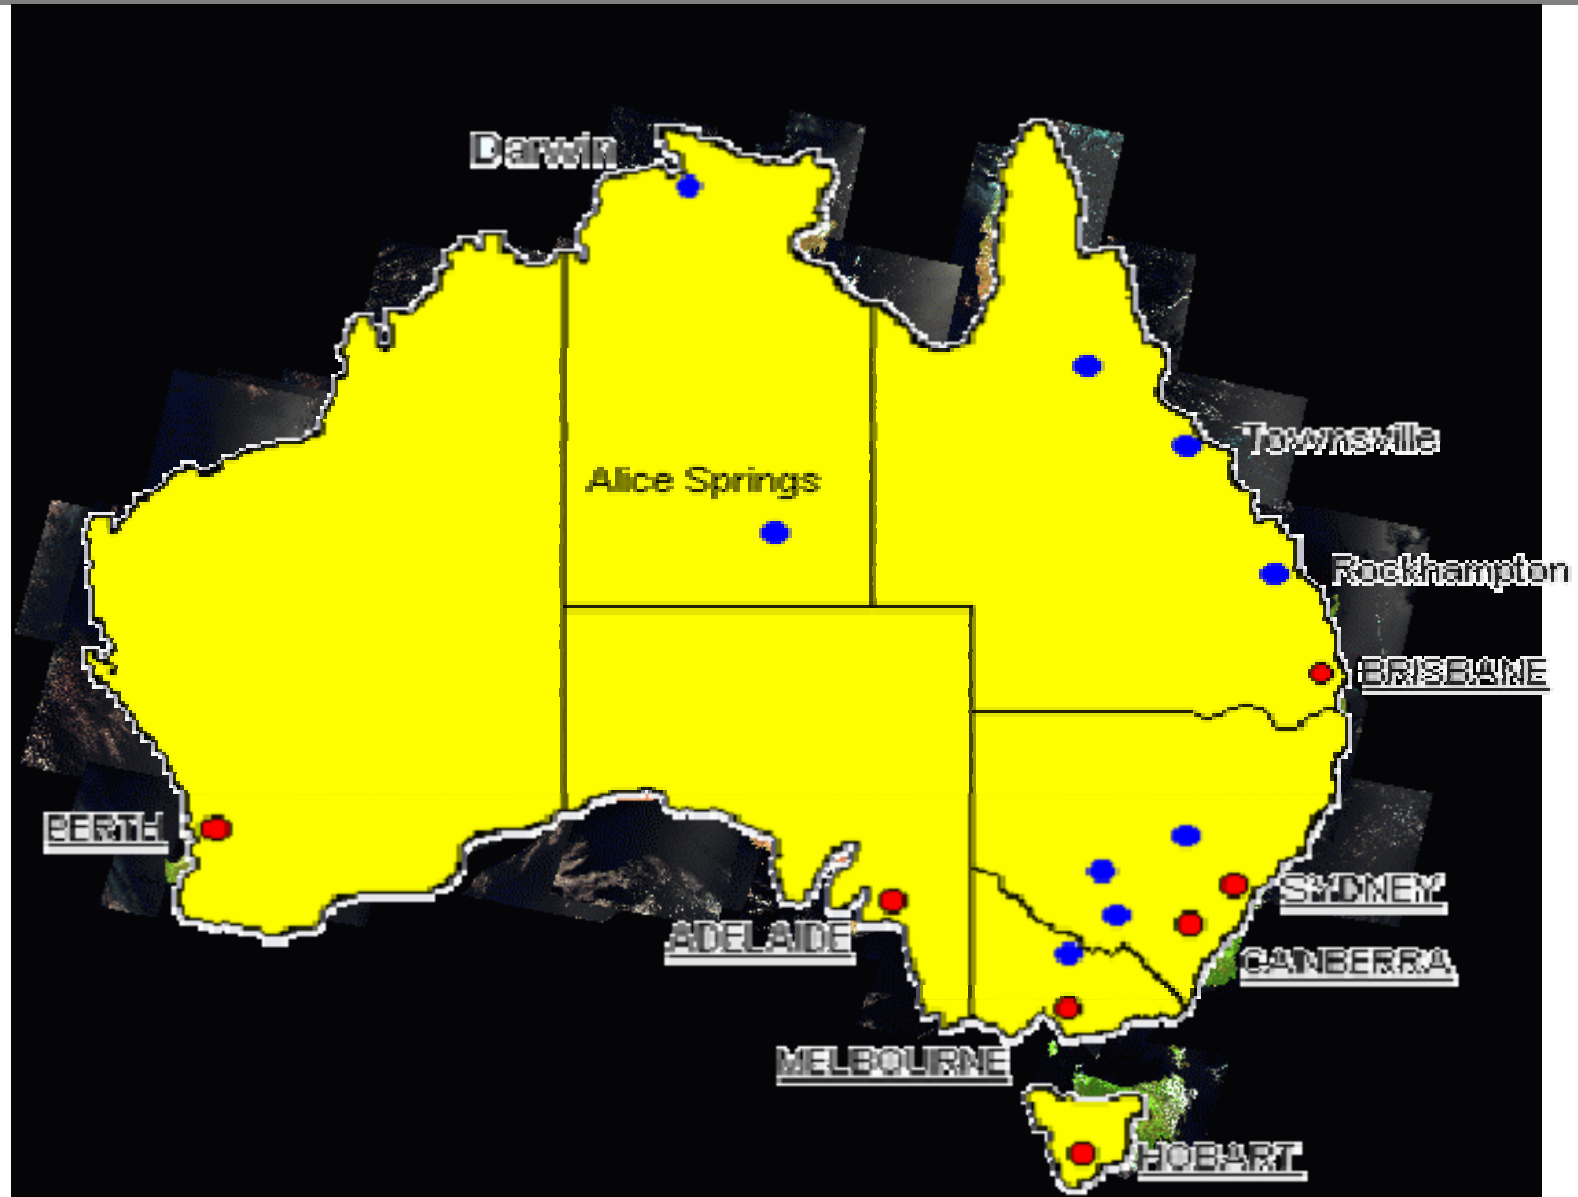

The Plan

- ✚ Australia in context
- ✚ LADM – our first coupled Mesoscale Meteorological + Lagrangian particle model (off-line)
- ✚ TAPM – *in-line* coupled comprehensive *PC-based* Meteorological and Lagrangian/Eulerian chemical transport model
 - ✚ TAPM-CTM — Extension to complex chemistries (CB 2005)
 - ✚ LWM model for road-scale effects
- ✚ AAQFS – operational BoM NWP + TAPM-CTM (supercomputer, off-line)
- ✚ ACCESS – starting Earth System Science model with HADGEM in collaboration with Hadley Centre
- ✚ Mention experiences along the way

AUSTRALIA IN CONTEXT

LADM

First CSIRO integrated System

Started in 1986 by off-line coupling of Pielke mesoscale model with McNider particle model.

A specially developed NWP model + Lagrangian particle model → LADM (again off-line)

Visualisation has proven to be a key to usability and communicating results

Rapidly learnt that:

- + Recirculation of pollutants to a region is very important in our setting**
- + High resolution for the accurate timing and location of the sea breeze is vital for success against data.**

TAPM

www.csiro.au/tapm

www.csiro.au

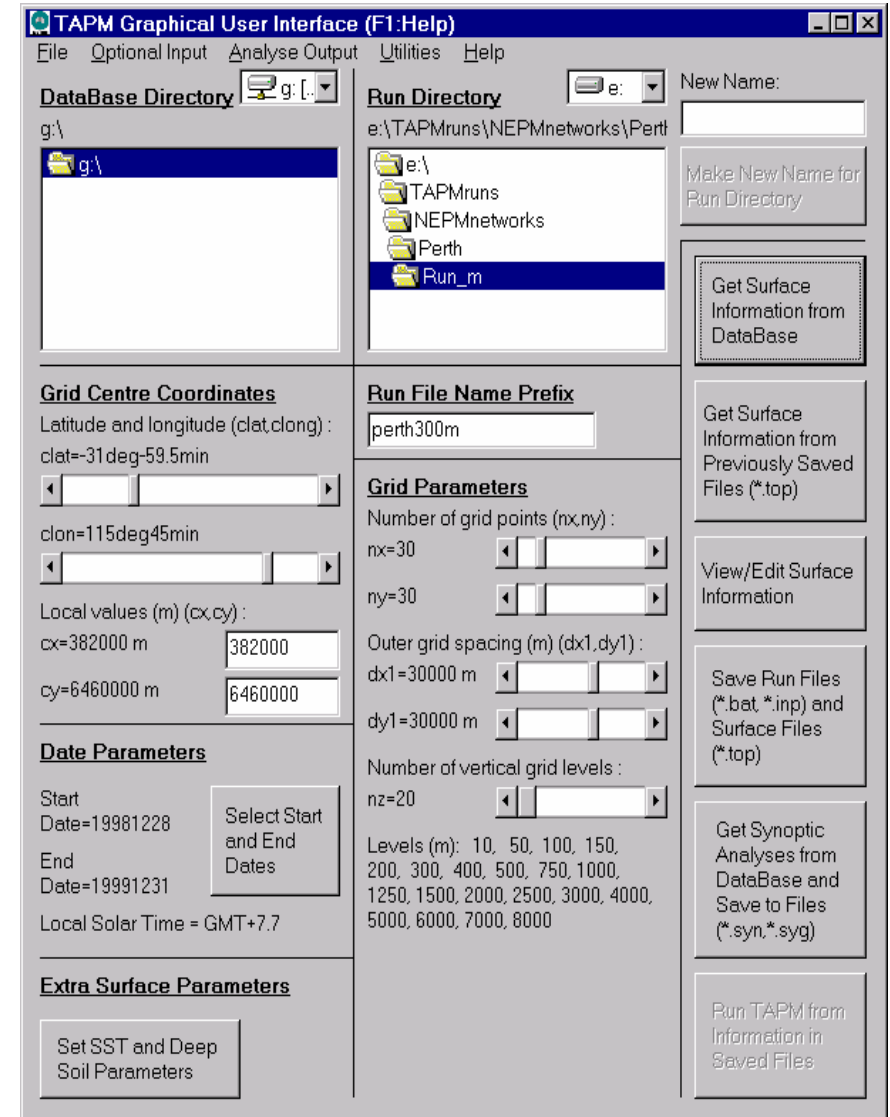

TAPM DESCRIPTION

Predicts both meteorology and air quality for a period of a day to a year or more with hourly results on grids down to 300 m spacing

Runs on a PC using a GUI or on a cluster via scripts

The GUI sets up grids, runs model and post-processes results

Gridded terrain, land-use and 6-hourly synoptic 3D analyses of meteorology on CDs

Model Description

The Air Pollution Model (TAPM)

- Meteorology
 - 3-D, Eulerian, nestable;
 - incompressible, non-hydrostatic;
 - winds, temperature, pressure, water vapour, cloud and rain water, turbulence kinetic energy and eddy dissipation rate;
 - surface scheme (soil and vegetation);
 - cloud microphysics scheme;
 - radiation scheme;
 - wind data assimilation.

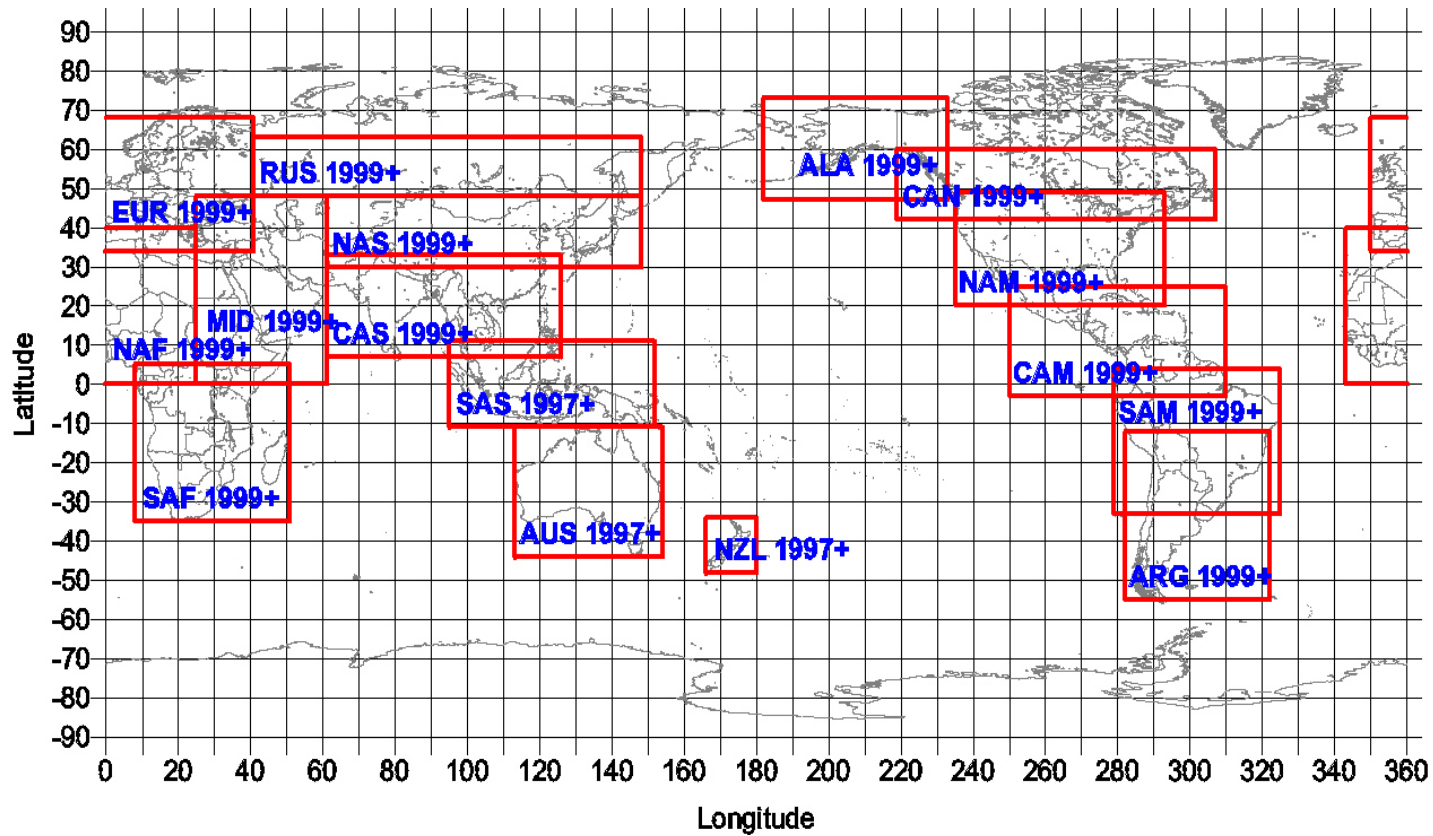

Model Description

The Air Pollution Model (TAPM)

- Air Pollution
 - 3-D, Eulerian, nestable;
 - tracer or multiple pollutant modes;
 - Lagrangian particle module;
 - plume rise & building wakes;
 - simplified photochemistry (GRS);
 - aqueous chemistry;
 - wet and dry deposition;
 - emissions from point, line, area & gridded sources.

Results (1hr x 1year) – PM₁₀ (24hr ave.)

TAPM – without wind data assimilation

TAPM# – with wind data assimilation

Summary

TAPM is based on complete equations

PC-based and easy to use

Predicted meteorology for almost any region

Non-reactive and photochemical pollutants

Discrete sources: point, line , area/volume

**Gridded emissions: biogenic, industrial, vehicle,
commercial/domestic, wood-heater sources**

Verified for meteorology and air pollution in many studies

Used by 90 Licensed Groups in 18 countries: 154 licences

Web: <http://www.cmar.csiro.au/research/tapm/index.html>

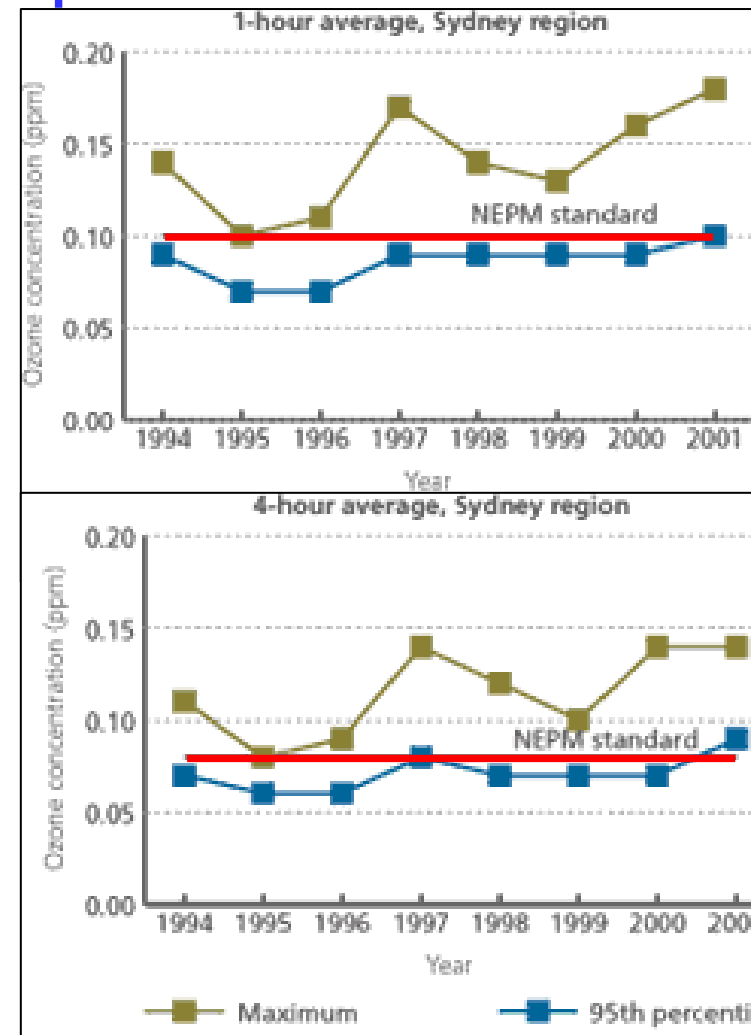

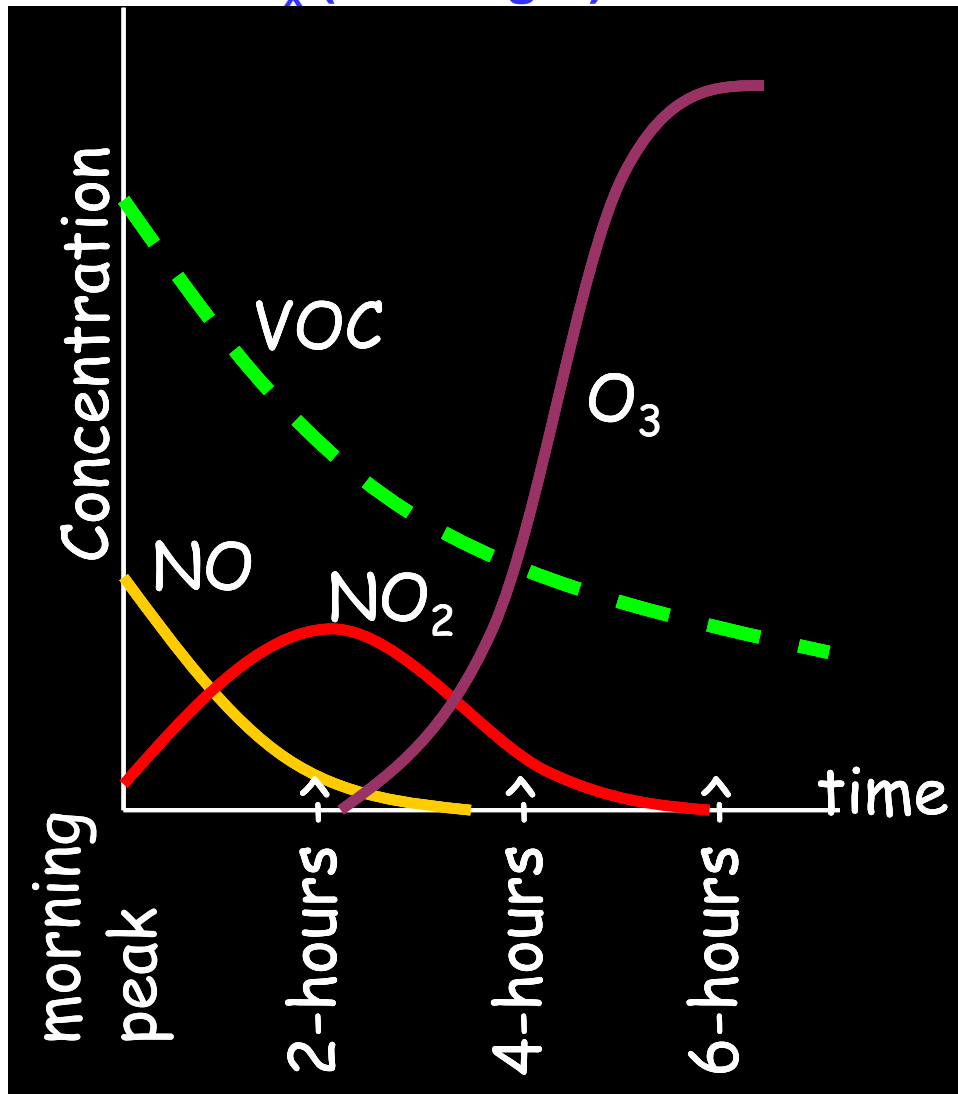

TAPM-CTM

Photochemistry – the Sydney problem

VOC + NO_x (+ sunlight) → ozone + other products

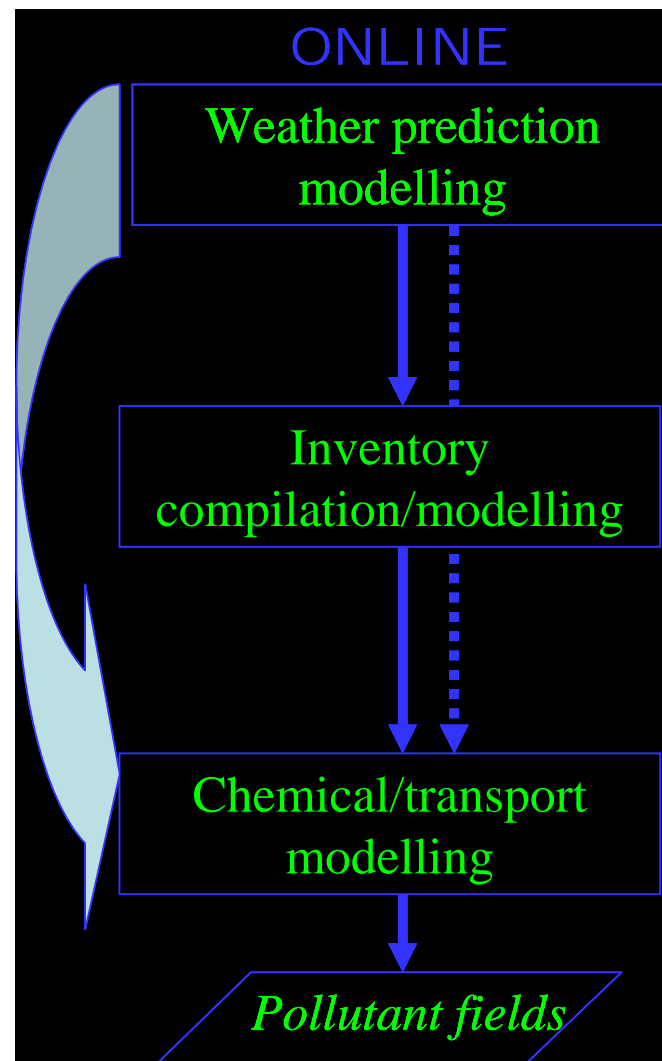

<http://www.epa.nsw.gov.au/soe/soe2003>

Sydney Seasonal Photochemistry Modelling System

Require a system with the ability to model meteorology, emissions and chemical transformation over hourly to seasonal time scales:

- + TAPM meteorology +
- + Extended chemistry
 - Carbon Bond 2005 – 51 species, 155 reaction pathways

Modelling Configuration for a Study

Grid system

60 x 70 (12, 6, 3 km);
12 km domain height (TAPM);
4 km domain height (CTM);

Integration period

3 x 5 month simulations
(November-March)
2000/2001; 2003/2004; 2004/2005;

Initial and boundary conditions

GASP (BoM global NWP)
- Assimilate winds from 115
near-surface sites

Computation

15 processors on HPCC Linux Cluster
48 h wall-clock per simulated month
0.5 terabyte data storage

6-km spaced grid and locations of near-surface wind observation sites

Anthropogenic Emissions

Vary anthropogenic emissions with temperature (and weekday/weekend)

Nitric oxide emissions show typical traffic-based diurnal variation; VOC emissions show stronger temperature variability with afternoon peak due to enhanced traffic evaporatives under higher ambient temperatures

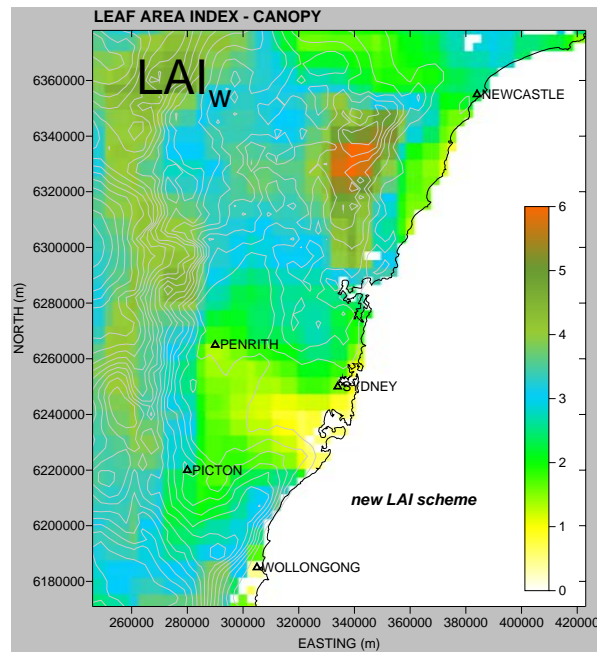

Biogenic Emissions- up-scaling

Canopy

$$q_{st} = f(T) \times 25 \mu\text{g-C g}^{-1}\text{h}^{-1} \text{ (eucalypt)}$$

$$B_m = 100 \times \text{LAI}_w(x,y) \text{ g m}^{-2};$$

h_c = function of land-use category;

LAI_w = wooded land-use

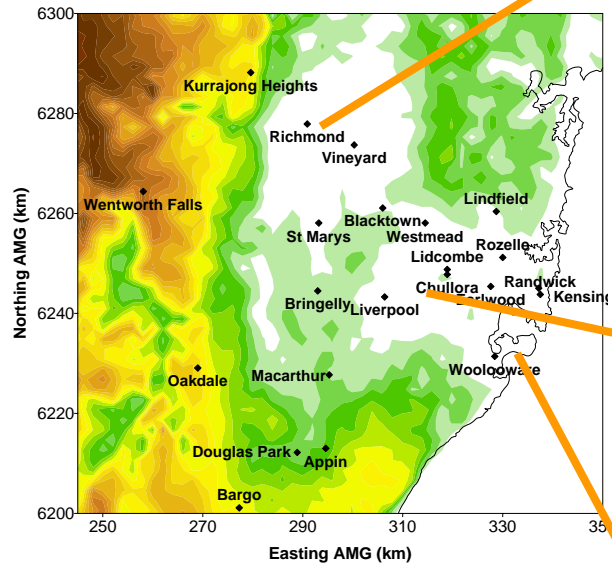

Observed and modelled in-canopy isoprene and oxidation products

CCAM + TAPM

CCAM set up for Australia

To achieve high resolution over any selected location, the first panel of the cube is shifted over that location, then the Schmidt transformation is applied to map to sphere - preserves orthogonality and isotropy

Resolution over Australia is about 60 km, with Schmidt factor = 0.3

Features of CCAM dynamics

**2-time-level semi-Lagrangian, semi-implicit
total-variation-diminishing vertical advection**

reversible staggering

❖ has very good dispersion properties

**selective off-centring in time (to avoid semi-Lagrangian
mountain resonances)**

❖ leads to better tropical rainfall

***a posteriori* conservation of mass and moisture**

Schmidt transformation used for zooming

non-hydrostatic version now available

•denotes only feasible in C-CAM and some grid-point models

•denotes also possible for spectral models

Expected Changes in urban ozone

In Sydney, currently 15 days per year above 30°C. Predicted to be between 18–31 days by 2030, 22–117 days by 2070.

Ozone formation increases with temperature.

Secondary aerosol production will increase

Dispersion meteorology is likely to change

We are tracking the higher emissions scenarios – A2 is very reasonable

SRES Emission Scenarios:

A “family” of future emission trajectories, for a range of economic, technologic and society futures

Rahmsdorf et al. 2007

Approach (current)

Compare ozone levels for
3 decades: 1996–2005,
2021–2030, 2051–2060.

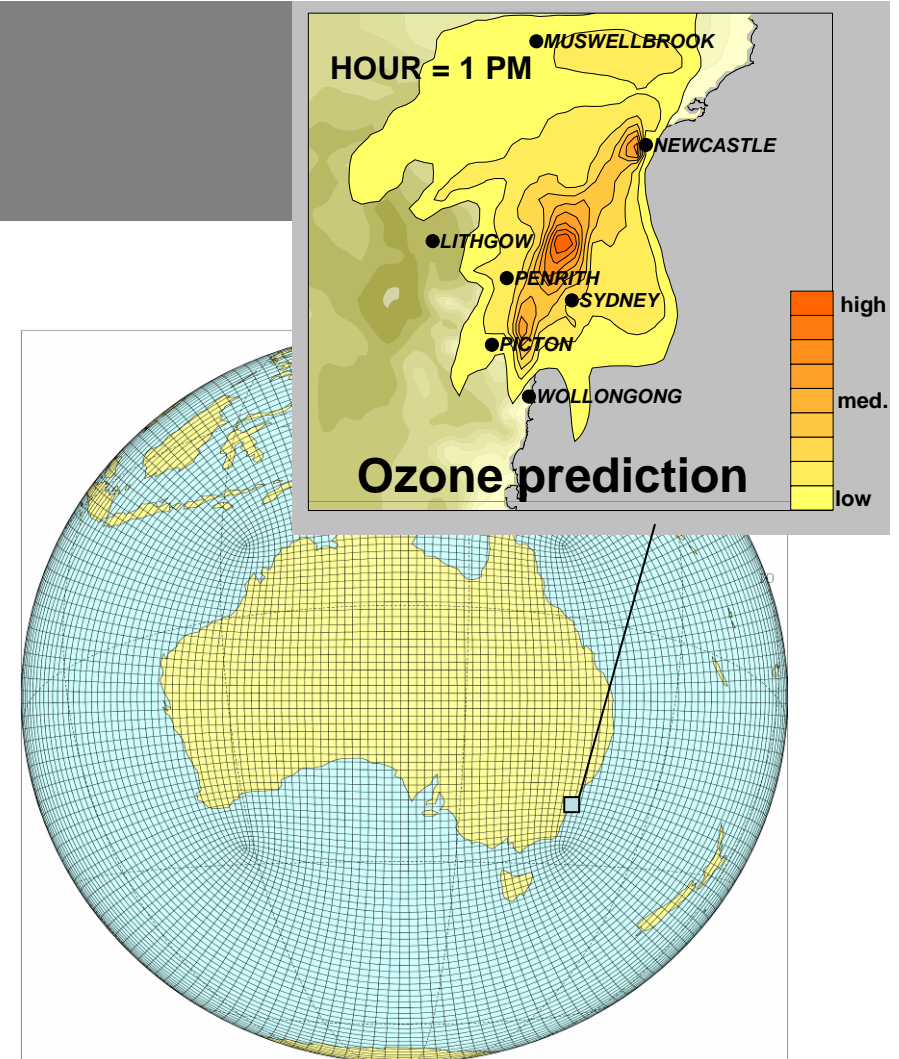

Nest TAPM-CTM (grid spacing
3 km) into CCAM regional
simulations for these periods

Eg for Sydney, could calculate a
relative risk (of ?) for $O_3 > 30$ ppb:

1996–2005: 0.65%

2021–2030: 0.78% ie +20%

2051–2060: 1.04% ie +50%

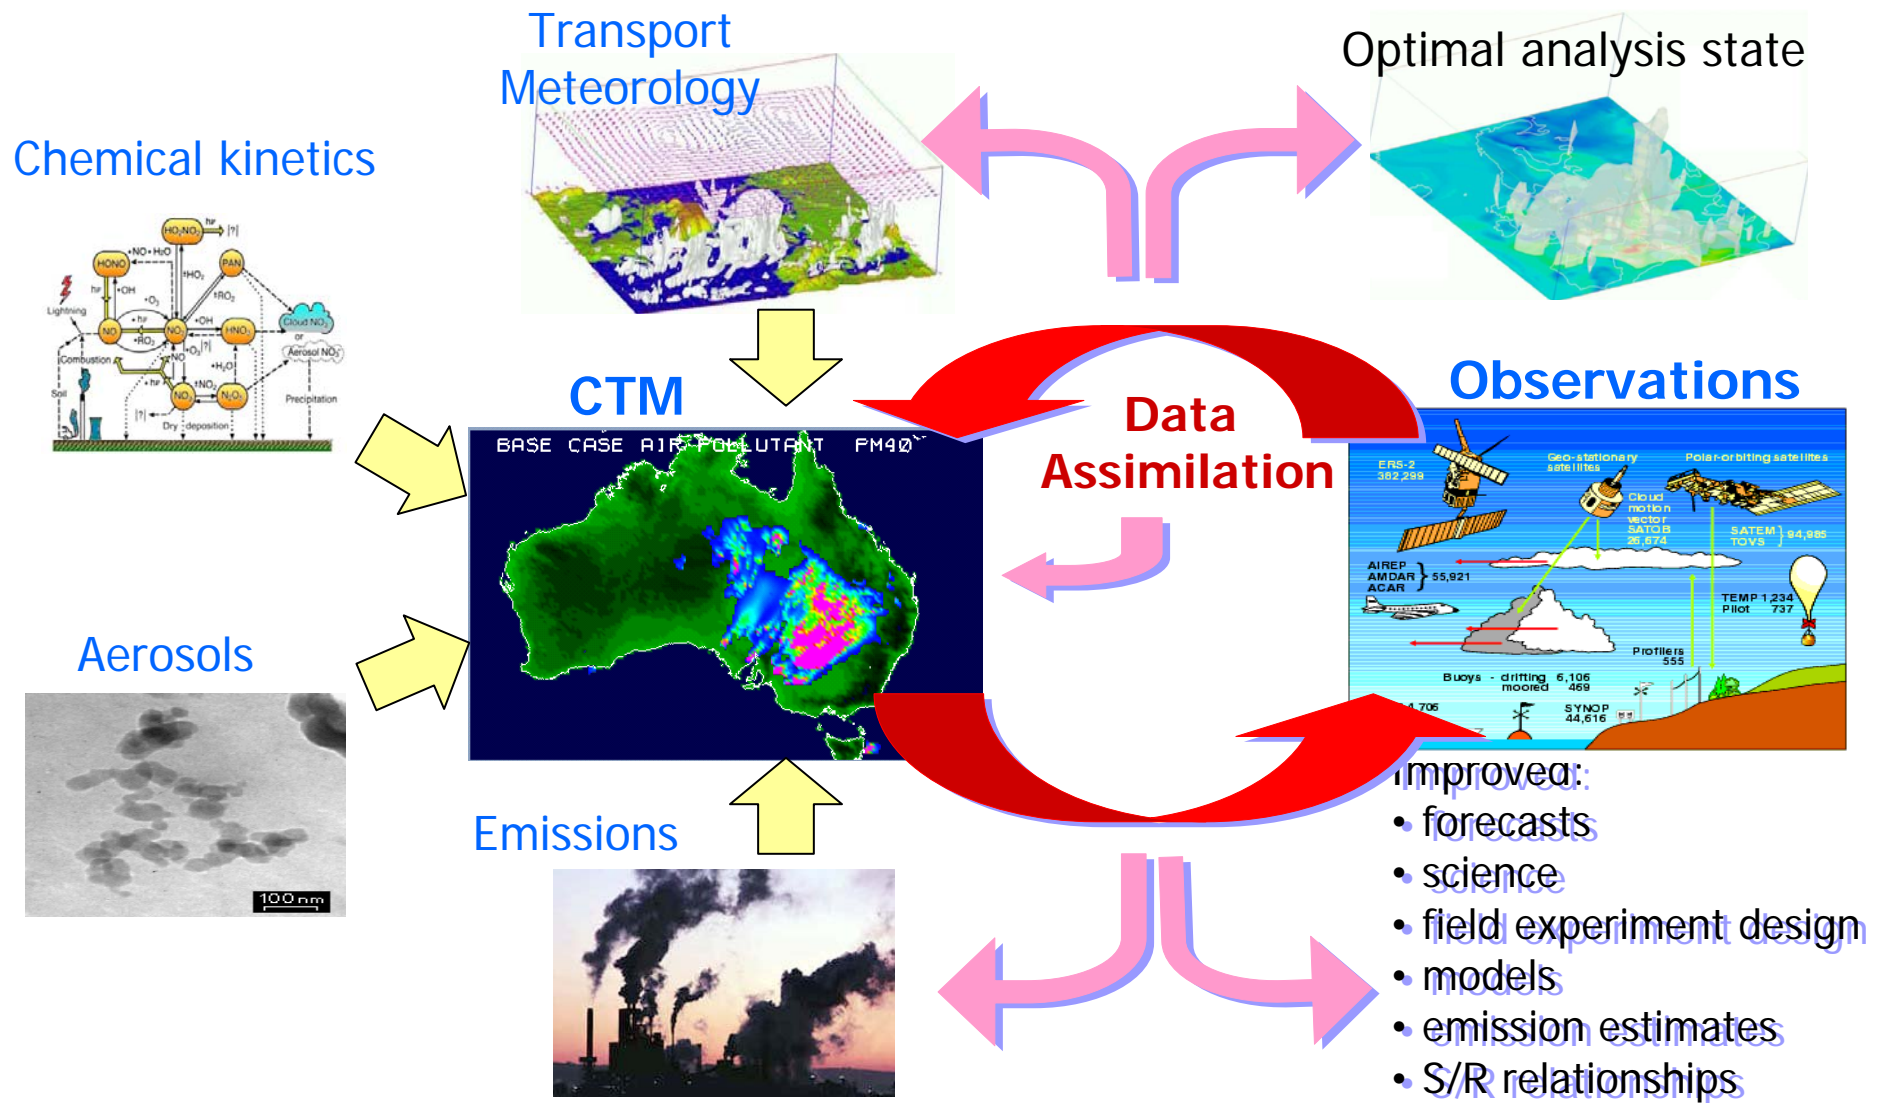

CCAM grid- effective resolution of
70 km over Australia

OBJECTIVES OF ACCESS

The Australian Community Climate Earth-System Simulator (ACCESS) is a coupled climate and earth system simulator to be developed as a joint initiative of the Bureau of Meteorology and CSIRO in cooperation with the university community in Australia.

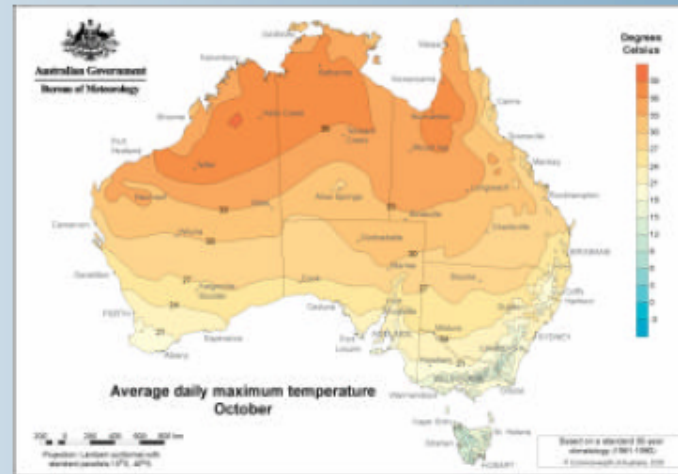

The key objectives of ACCESS are to create models and modelling outcomes that:
